Abstract

In this study, the efficacy of *Coriandrum* and *salvia* extracts in spatial and passive avoidance memory in mice was studied. 56 male mice (25-30g) divided randomly into 8 groups: negative control, positive control and extract administered (50, 100 and 200 mg/kg of both plants), and treated for 25 days. negative and positive control group received normal saline and Ritalin respectively. After training, passive Avoidance memory was measured with shuttle box and spatial memory was measured with Morris water maze and Y maze, twenty-four hours and one week after the last injection. Finally, blood samples were collected, MDA and SOD in serum were measured using ELISA kits of Zell Bio, Germany. Data were analyzed by using ANOVA and Tukey test. The $P < 0.05$ was considered significant. Data analysis showed both *Coriandrum* and *salvia* hydroalcoholic extract (200mg/kg) improved passive avoidance memory ($P < 0.01$) and spatial memory ($P < 0.05$) in mice in compared with control groups. after one week this effect was seen in *salvia* but wasn't seen for *Coriandrum*. and in both group (100 and 200mg/kg) amount of MDA was significantly decreased, but no significant change was observed in the SOD content between them. It seems that the beneficial effects of these plants on memory related to oxidative stress indices and reducing the level of lipid peroxidation of the serum but other mechanisms maybe have effect in longer efficacy in *salvia* rather than *Coriandrum* and more studies is needed to determine the mechanism this effect.

Keywords: *Coriandrum Sativum*, *Salvia Officinalis*, Memory, Oxidative Stress, Mice
